

Evolution

(Solo) Earth sleeps undisturbed as life awaits the celestial spark.

(Chorus)

We can wiggle, we can squirt. We can crawl the ocean floor. We can swim in silv'ry schools. We can walk the far shore.

We can hop and run and dance, We can glide and flap our wings, we can build a wheel and cart, we can do a myriad things.

Evolution! (We can do it better.) It's not finished. (We will survive.) We're still changing. (We are the fittest.) Evolution.

Man ascended (Science tells us) from the monkeys.

We can sign and chirp and speak. We're communicators. We can read and write and plan. We're prognosticators.

We can mutate and change our stripes. We can mate and blend our types. Promise lies within our genes. Time will tell what each step means.

Evolution (competition) keeps on churning, (makes us strong) ever turning, (ever upward) evolution.

We are algae, ferns and trees. We are cells and organs. We are flocks and families. We are tribes and nations.

We are life on planet Earth, rising from a long sleep, climbing toward the starfilled skies, seeking to complete the leap.

Evolution (up the food chain) It's a theory, not a law. Life so complex seems designed. Some are leary of evolution.

Who could dream a grander way to create a world of life? Should we start with Adam, Eve, and a wily serpent? Much more God-like would it be to set out all the elements and let life build from cell to cell according to its own bent.

Evolution! (Ever clever to design life...) Strength through strife! (as a process...) Learn from living! (of improvement.) Evolution.
